

Training

Observed series $x^{(j)}$

Observed grid $\mathcal{T}_{in}^{(j)}$

$z^{(j)}$, θ and w are optimized according to Algorithm 1 on : $\mathcal{L}_{\mathcal{T}_{in}^{(j)}}(\tilde{x}_t^{(j)}, x_t^{(j)})$

Inference

1) Only $z^{(j)}$ is optimized through a 3 steps gradient descent on $\mathcal{T}_{in}^{(j)}$ to condition the network per time series $x^{(j)}$

2) Then, we can infer $f_{\theta, h_w(z^{(j)})}(t)$ for any $t \in \mathcal{T}^{(j)}$

Observed grid $\mathcal{T}_{in}^{(j)}$

Infer values on the dense grid $\mathcal{T}^{(j)}$
